PROFILE

AI carries risk. Code bounds it. The standard answers for what remains.

Programmer since 2023: Code Institute, Python at work in 2024 and, since March 2026, AI pipelines that run on real data, with measured numbers, written limitations and public code. I work from one simple idea: every AI application has five steps and only one invokes a model; the other four are code. When those are done properly, what is left in the middle fits in one call, and the result is cheaper, stronger and auditable. I have worked with a Tier 1 automotive supplier, where regulation rules and a silent error is expensive.

PUBLIC PROJECTS

CTSM

epifaneia/ctsm · 2026

Audits the requirements of a customer specification (a Polarion ReqIF) against the supplier's manuals and returns the same file with the evidence and its exact page. The model may only cite fragments from a closed list; code verifies every quote against the source and derives the page from the offset. **9/9 against ground truth with a local 14B model · zero false "compliant" · round-trip diff tested against 5 sabotages.**

reqif-extractor

epifaneia/reqif-extractor · 2026

From a specification PDF to a ReqIF that Polarion imports on the first attempt: verbatim identifiers, document hierarchy, page order. Deterministic identifier policy and type reconciliation against the source. **Without the policy, the model invented 167 of 170 identifiers · ~1/15 of the vision cost, keeping 98.4% of items by routing only tables and figures · 12/12 real documents structurally validated.**

toolkit

epifaneia/toolkit · 2026

The reusable part of every pipeline: one tool per design step, generic guardrails and three integration wires to the company's systems (identity, event ledger, sign-off), with tests and a documented integration for Entra ID, SIEM and PKI.

feasibility-study

epifaneia/feasibility-study · 2026

From a meeting form to an AI feasibility study in PDF: an autonomous research run across hundreds of pages, turned by code into a report with our narrative and our order, with cited sources. Form, FastAPI server, consultant panel and human review before sending.

EXPERIENCE

AI Solutions Designer

March 2026 – present

Epifaneia · Seville, remote

Design and delivery of AI pipelines with a chain of custody for industry and regulated processes: the projects above and a mobile voice-conversation app with a model per stage.

Recurring ReqIF conversion engagements

June – September 2026

Senior engineer at a Tier 1 automotive supplier · remote

Batches of customer specifications converted into Polarion-ready ReqIF with reqif-extractor, processed in the cloud with the client's authorisation; every delivery reviewed by him.

Bilingual account specialist

2024 – present

Foundever · Airbnb programme · Seville

Advanced customer support in English, in parallel with Epifaneia.

Automation programmer and telesales agent

March – December 2024

Konecta · Seville

Started as a telesales agent and joined the project automating the KPI system: the team's reporting with Python (Pandas, openpyxl) over Metabase exports, in iterations reviewed by the data analysis team.

Risk analysis, quality and training

2017 – 2023

TaskUs, Prepaid Financial Services, Media Interactiva, Field Management · Ireland and Spain

Financial risk analysis, quality auditing and agent training at TaskUs, including an AI model training programme; software QA at Media Interactiva. Six years working in English.

EDUCATION

Diploma in Full Stack Software Development

January 2023 – April 2024

Code Institute · university credit-rated (University of the West of Scotland)

Five portfolio projects: an accessible website (HTML, CSS), a JavaScript game, a Python game on the Google Sheets API, a Django library with authentication and reviews (rebuilt in 2026: epifaneia/neuralib) and a convolutional network that classifies images (Mildew).

Studies in Philosophy and in Physics (several years) — University of Seville

SKILLS

Applied AI

LLM pipelines with structured output, dynamic enums and deterministic verification. Local models (Ollama, Qwen 7B/14B) and cloud (Gemini) under one contract. BM25 retrieval. Calibration and measurement against ground truth. Agents with CrewAI (Flows and Crews with RAG) when the problem calls for them.

Machine learning and data

Convolutional networks with TensorFlow/Keras: data preparation and class balancing, train/validation/test split, evaluation. Pandas, NumPy, Matplotlib, Jupyter, Streamlit. PDF (PyMuPDF, Docling, gmft), XML and ReqIF (lxml), SQLite.

Code

Python (FastAPI, Django, lxml), JavaScript and TypeScript (React Native, Expo), HTML and CSS. Git, Docker, Heroku, tests and coverage. AI-assisted development with my own review, verification and guardrails.

Regulation

EU AI Act, ISO/IEC 42001, ISO/IEC 27001, GDPR, TISAX. ISO 26262 and ISO/SAE 21434 context. Polarion.
